

2.1.1 Domain Rough Sketch (Raw Stories)

Raw Story: First Week Attempting Cardio

Athlete recounts:

"I started with treadmill jogging at 5.0 mph. This was only my fourth day ever trying to work out consistently. My heart was already beating fast before I even hit 'Start.' As soon as the treadmill sped up, I felt awkward, like my stride wasn't natural. My arms swung too stiffly, and my breathing felt shallow.

The first few reps (really the first few strides) felt heavy and uncoordinated. My legs weren't used to the movement, and I could feel the impact in my shins. I tried to settle into a rhythm, but the belt felt too fast even at a moderate pace. Sweat started forming on my forehead way earlier than I expected.

On minute 3, I noticed a side stitch forming and my calves tightening sharply. The stitch felt like a sudden jab under my ribcage, and it made me panic a little. My calves burned with every step, and my breathing became louder and more erratic. I kept looking around hoping nobody noticed I was struggling.

I paused briefly to decide whether to continue. I brought my hands to the side rails and slowed to a walk, trying to catch my breath. I debated whether pushing through would help or just make me feel worse. My chest felt tight, and the stitch wasn't fading fast enough.

I tried jogging one more interval but my breathing spiked and my legs felt wobbly. Within seconds of speeding up again, my chest burned, and I felt lightheaded. My feet were slapping the treadmill instead of landing smoothly. I knew I wasn't moving efficiently at all.

I stopped early because I didn't want to push myself into a full cramp or panic attack. My body clearly wasn't ready for more, and I stepped off the treadmill feeling overwhelmed but proud that I even showed up."

Raw Story: Returning to Squats After Injury

Lifter recounts:

"I started with barbell squats at 95 pounds. I hadn't touched squats in almost two months because of a lower-back injury, so even loading the bar felt like a mental battle. I took longer than usual setting my feet and gripping the bar because I was second-guessing my stance. Lowering into the first rep felt foreign, like my body had forgotten the movement pattern. The gym was noisy around me, but all I could focus on was whether my back would suddenly tighten again.

The first few reps felt tight and slightly unstable through my hips. I could tell immediately that my bracing wasn't as strong as before the injury. My core felt soft, and the bar drifted slightly to the right on the ascent. I wasn't in pain yet, but I felt an uncomfortable tension on the right side of my lower back. Each rep made me more aware of small weaknesses I hadn't noticed before, and it made me nervous.

On rep 4, I noticed my torso pitching forward and my lower back tensing unexpectedly. It wasn't a sharp pain, but a sudden shift in sensation that made me panic a little. My chest dropped too fast, and my heels felt like they were pushing unevenly into the floor. I immediately thought, 'If I keep going, this could go wrong fast.' My confidence dropped in an instant.

I paused briefly to decide whether to continue. I stood there with the bar on my back, breathing slowly, trying to interpret the sensation. Was it actual danger or just fear? My heart was beating faster than the weight deserved. I stared at myself in the mirror, trying to read my form and decide if pushing another rep was worth the risk. My legs felt okay, but my back felt unsure.

I tried one more rep but my brace collapsed and the movement felt unsafe. As soon as I descended, I felt my core loosen. The bar shifted slightly, and I could feel the load compress my back in a way that didn't feel controlled. The rep slowed dramatically halfway up, and I had to grind it out with bad leverage. Everything about it felt wrong.

I stopped early because I was terrified of re-injuring myself. I racked the bar faster than usual and stepped away, feeling frustrated and embarrassed. But I knew if I ignored the warning signs, I could end up sidelined again. I ended the exercise right there, choosing caution over ego."

Raw Story: Fatigue on Push Day

Gym-Goer recounts:

"I started with incline dumbbell press at 70 pounds. I've been training almost daily, so I walked in expecting my pressing strength to feel normal. But the weights felt heavier than usual right from the unrack. I took a deep breath, squeezed my shoulder blades back, and began my first set. The gym lighting was bright, and I could see my reflection clearly struggling to stabilize the dumbbells.

The first few reps felt smooth but noticeably slower and less explosive. Normally the weight moves cleanly off my chest, but today I felt a slight lag. My left shoulder felt tight, like the joint wasn't tracking correctly. The tension built faster than I expected, and I felt the pump coming way too early into the set. It felt off.

On rep 6, I noticed my left arm drifting outward and my chest fatiguing faster than normal. The dumbbell wobbled, and I had to fight to control the path. The burn intensified suddenly, and the imbalance made me nervous. It felt like my left side wasn't doing its share of the work, and my right arm was compensating.

I paused briefly to decide whether to continue. I held the weights at the bottom for a moment, breathing hard, debating if I should force the next reps or bail early. Sweat started forming on my forehead, and I could hear my breathing echo in my ears. I knew another rep might fall apart, but part of me wanted to push through anyway.

I tried one more rep but the dumbbell slipped out of its groove and my form collapsed. My shoulder rolled forward slightly, and the dumbbell shifted toward my midline in a way that felt dangerous. My tricep started shaking, and I knew the rep wasn't going to be clean—or safe. I barely stabilized it enough to place the dumbbells back onto my thighs.

I stopped early because my shoulder felt unstable and I didn't want to strain anything. I walked

away annoyed because this was supposed to be a strong day, but the signs were clear: my body wasn't ready for heavy sets today."

Raw Story: Trying to Hit Everything at Once

Gym-Goer recounts:

"I started with bench press at 95 pounds. Since I only lift once a week, I always feel rusty starting out. The bar felt heavier than I remembered when I unracked it. My setup felt rushed, like I wasn't fully aligned under the bar. I tried to focus on keeping my elbows tucked, but it already felt unstable.

The first few reps felt shaky and uneven between my arms. My right arm pushed harder than my left, and I could feel the bar wobble slightly. The reps didn't feel smooth—each one felt like my body was relearning how to press. My breathing got loud, and I could tell I wasn't bracing properly.

On rep 5, I noticed the bar drifting sideways and my elbows flaring outward. My chest started burning, and the bar slowed dramatically halfway up. Sweat rolled down my face as I fought to lock out the rep. I felt my shoulder tilt inward, which made me worry I was about to lose control.

I paused briefly to decide whether to continue. Holding the bar at the top, I tried to steady my breathing. I questioned whether my arms had another clean rep in them. My heart was pounding, and mentally I felt unsure. I didn't want to risk failing without a spotter.

I tried one more rep but my arms shook uncontrollably and the bar nearly stalled. The rep moved in slow motion, and I felt all the tension shift to my shoulders instead of my chest. I pushed through, but it felt unsafe the whole time.

I stopped early because I didn't want to risk failing the rep alone and injuring myself. I re-racked the bar carefully and sat up, feeling defeated but also relieved I didn't push too far."

2.2.2 Personas

- Alex, the Beginner:
 - Background and daily habits: Alex is a 28-year-old office worker from Miami, Florida. He works long hours at a marketing firm and often ends the day feeling drained. Outside of working hours, he enjoys cooking simple meals, listens to podcasts about technology and entrepreneurship, and occasionally playing casual mobile games to relax. Alex is new to fitness and often feels overwhelmed and feels out of place in a public gym, unsure of where to start or whether he is making any progress. His primary goal is to build a consistent workout habit to improve his health, energy levels, and overall well-being, as he feels sluggish from sitting all day at the office. His colleagues discussing fitness apps during lunch influences his desire for a polished, engaging user experience, which he might feel confident enough to share once he sees progress. Alex is motivated by music and likes to listen to high-energy playlists on Spotify during workouts to stay focused. He is curious, eager to learn, and wants clear guidance to help him feel confident and prevent unnecessary injuries as he begins his fitness journey.
 - Motivations and goals: Alex isn't just trying to "build a habit." He wants to improve his energy levels to be more effective at his marketing job and eventually perhaps start his own

business.

- Pain points and needs: The team will realize the app isn't just a fitness tool, but a stepping stone to entrepreneurial success and better time management, making features like progress visualization extremely important for tracking overall life progression, not just reps. Gym Anxiety, this suggests he would benefit from a "solo mode" or privacy settings initially. Alex's interest in cooking simple meals suggests he might appreciate a section in the app with quick, easy-to-follow healthy recipes that fit into his busy evenings. Alex interest in listening to music during workouts present expectation of seamless integration with existing tools like Spotify or other tools. Current fitness apps only log data but fail to provide engaging feedback or build motivation. Alex struggles to understand fitness terminology and is unsure if his training is balanced, leading to a fear of developing imbalances or injuring himself by overdoing certain exercises. Additionally, he prefers features that fit into busy, irregular schedules and offer clear visual rewards. He needs an intuitive, encouraging, and gamified guide to help him build a foundation.

- Diego, the Competitive Gamer:

- Background and daily habits: Diego is a 22-year-old computer science student from San Juan, Puerto Rico. He spends much of his free time gaming, streaming, or coding with friends online. He loves competitive environments and progression systems, whether it's climbing ranked ladders in his favorite games or improving his game stats. Outside of gaming Diego enjoys testing with his friends who have more strength, endurance, or who can make the best dish, but he feels weaker than them in physical challenges. His feeling of being physically weaker than friends isn't just about gym stats; it's about social confidence and status within his friend group. Looking information online he stumbled across how improving physical strength might also be linked to improving focus for long coding sessions and started to consider going to the gym. Although he joined a gym last semester, he quickly lost motivation because he doesn't get the feeling of achieving, often translating to a feeling of wasted time.
- Motivations and goals: Diego wants a fitness app that makes working out feel like leveling up in a video game. He is motivated by points, rankings, and visual progress bars that show him getting stronger in real time. His main goal is to stay consistent by turning workouts into daily "missions" that reward effort and let him compete with friends. He also wants to improve his physical strength so he can win physical challenges against his friends.
- Pain points and needs: The app's competitive elements need to be robust enough to help him earn bragging rights, not just personal points. Competition against his friends is a major motivator. The app needs highly developed social challenge features, perhaps customizable duels or guild-like team goals, not just a simple leader board. Current gym apps feel lifeless to him; they only track sets and reps without giving a sense of reward or excitement. He struggles with accountability when training alone and needs an app that transforms progress into a fun, measurable system that keeps him hooked like a game. He also wants an app that provides clear, visual indicators of his improvements as if he is improving stats in a game. His computer science background suggests he is comfortable with technology and likely expects a sophisticated, bug-free, and well-designed interface, not a basic app.

- Sarah, the Consistent:

- Background and daily habits: Sarah is a 32 year old teacher from Austin, Texas, who has maintained a regular gym routine for the past two years. She teaches high school health and

wellness classes, and her curiosity about nutrition, fitness, and exercise science allows her to apply what she learns both in school and in her personal life. She is knowledgeable about basic exercises and tracks her sets and reps diligently in a notes app. She enjoys the discipline of training and typically works out early in the morning before school to maintain consistency. Outside the gym and school, Sarah enjoys reading about nutrition and wellness, trying out new healthy recipes, and occasionally attending local fitness classes to expand her knowledge. As a busy teacher, time is precious and likes to plan ahead during the week. She secretly allows herself a cheat day every two weeks, indulging in foods like Burger King or fully loaded pizzas. As a health teacher, hitting a plateau has been slightly embarrassing or frustrating for Sarah because she feels she "should" know better. She suspects she may be neglecting certain muscle groups but lacks the data to confirm it.

- Motivations and goals: Her goal isn't just about lifting heavier weights; it's about a continuous quest for knowledge and mastery of health and wellness. Sarah wants to optimize her training to overcome her current progress plateau. She is motivated by measurable results and personal challenges, using data to track improvements and hold herself accountable. Her main goal is to ensure balanced development across all muscle groups while adding a new layer of challenge and enjoyment to her well-established fitness routine, beyond simply lifting heavier weights.
- Pain points and needs: Sarah has hit a progress plateau and feels her workouts have become repetitive. She suspects she may be neglecting certain muscle groups but lacks the data to confirm it. Her current tracking method is fragmented and offers no actionable insights. She finds most fitness apps too simplistic and not designed for someone with her experience and discipline. She needs a tool that provides detailed, data driven analytics on her performance and muscle development. Her structured schedule suggests the need for features that allow for advanced planning, such as a robust weekly or monthly workout scheduler that can send calendar reminders to her work schedule.

- Marcos, the Motivator:

- Background and daily habits: Marcos is a 24-year-old graduate student from Chicago, Illinois, who treats fitness as a social activity. He works out with a close-knit group of friends, relying on their presence for accountability and friendly competition. Marcos and his friends constantly challenge each other to show up and push harder. He often shares workout milestones on social media like, Instagram but wishes there were a more integrated way to track his progress and stay connected with his friends' achievements. Outside the gym, Marcos balances his studies, part-time tutoring, and social life. He enjoys attending local fitness events, trying new workout classes, and exploring healthy restaurants with friends. He is curious about sports science and occasionally reads articles on training techniques and recovery methods. Although disciplined, he sometimes struggles to stay consistent when friends are unavailable or during particularly busy weeks, which makes him value social accountability even more. Marcos also enjoys mentoring others in fitness and often motivates classmates or peers to adopt healthier habits. He sees exercise not just as a personal goal but as a way to connect with others, challenge himself, and maintain a sense of structure in his life.
- Motivations and goals: Marcos primary motivation is community, accountability, and shared achievement. He wants an app that strengthens his workout group's connection by making it easy to share progress, celebrate each other's accomplishments, and maintain streaks together. He thrives in a positive, friendly competitive environment that emphasizes

consistency and effort rather than solely focusing on raw strength. Beyond personal improvement, Marcos also wants to inspire and motivate others, helping peers adopt healthier habits while enjoying a sense of community and shared challenge.

- Pain points and needs: Marcos already uses Instagram for sharing. The app needs highly polished, shareable visual summaries of achievements that are optimized for social platforms, leveraging his habit to attract new users and enhance existing engagement. There is no seamless way to create a private leaderboard with just his friends to track consistency, celebrate milestones, and encourage each other. He struggles to stay motivated when his workout group is unavailable and wants a platform that fosters a small, supportive community centred around collective growth. The pain of friends being unavailable isn't just about missing a workout; it's about feeling isolated. Mentoring others in fitness gives Marcos a sense of purpose. The app could integrate a "mentor mode" or a public "coach profile" where he can track the progress of those he mentors, reinforcing his role as a leader and motivator. His focus on positive competition and motivation suggests that gamification should prioritize "praise" and "high-fives" alongside raw ranking data. Features might include a robust set of positive reaction emojis or automated encouragement messages.

2.2.3 Domain Requirements

Principles

- Fitness as a Journey of Personal Progress
 - Improvement in strength, endurance, and consistency is a core driver of motivation. The system shall provide a mechanism with clear, quantifiable metrics and visual representations of a user's progress over time.
 - A balanced approach targeting all major muscle groups is essential for preventing injury and achieving a well-rounded physique. The system shall provide a mechanism that facilitate and encourage awareness of training distribution across the body.
- Engagement with Fitness Training
 - Long-term consistency requires more than initial novelty. The system shall implement a layered reward structure (e.g., XP, achievements, ranks) that provides continuous feedback and celebrates milestones of varying difficulty.
 - Fitness journeys can be reinforced through community. The system shall provide a mechanism for positive social comparison and mutual support that focuses on shared effort and consistency.

Functional Requirements

- Workout Logging **The system shall provide an interface for the user to log an exercise by specifying the exercise name, weight lifted, number of sets, and number of repetitions per set.
- Progress Tracking
 - The system shall calculate and display a historical graph of the total training volume (weight × sets × reps) for each muscle group over a user-selectable time period.
 - The system shall provide a mechanism that tracks and highlights new Personal Records (PRs) when a user logs a set with a higher weight for a given exercise than any previous set.

- The system shall provide a mechanism that suggest alternative exercises during the logging process if the user's current selection disproportionately targets an already dominant muscle group based on the "Muscle Balance Score".
 - The system shall provide a mechanism for the users to input goals based on specific timeframes and automatically generate a structured, periodized workout plan toward that goal.
 - The system shall provide a mechanism for users to publicly share "milestone posts" when achieving significant achievements to facilitate positive social reinforcement.
 - The system shall provide a mechanism that detects a performance plateau, the system shall provide automated suggestion to changes in repetition ranges.
- Gamification System
 - The system shall provide a mechanism that assigns a user a rank (Bronze, Silver, Gold, etc.) for each muscle group, calculated based on the total historical training volume and PRs for that muscle group.
 - The system shall provide a mechanism that awards users experience points (XP) for completing workouts and achieving milestones.
